Charge heterogeneity of mAbs

- Recombinant mAb heterogeneity due to manufacturing process, PTMs and during storage (degradation)
- Various mAb charge variants possible
 - can influence binding efficiency
 - impact on therapeutic effect
- Analytical techniques for charge variant separation
 - IEC
 - CZE (EACA)
 - IEF/CIEF/iCIEF

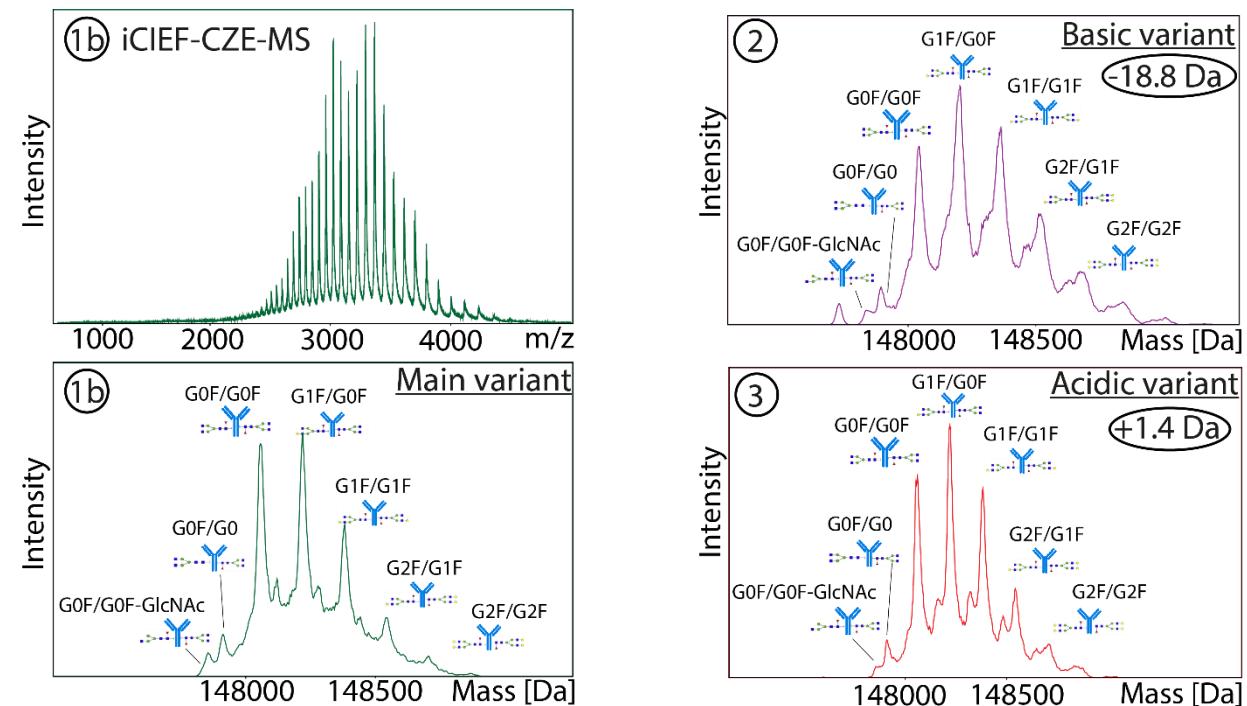

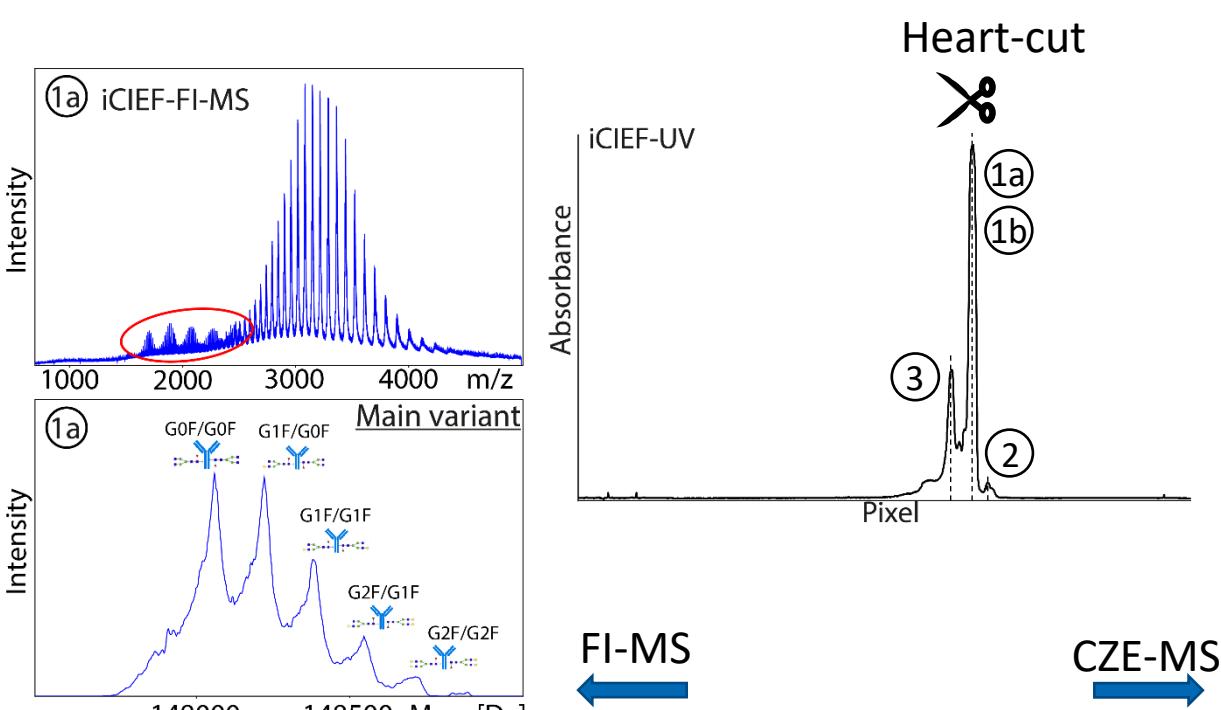

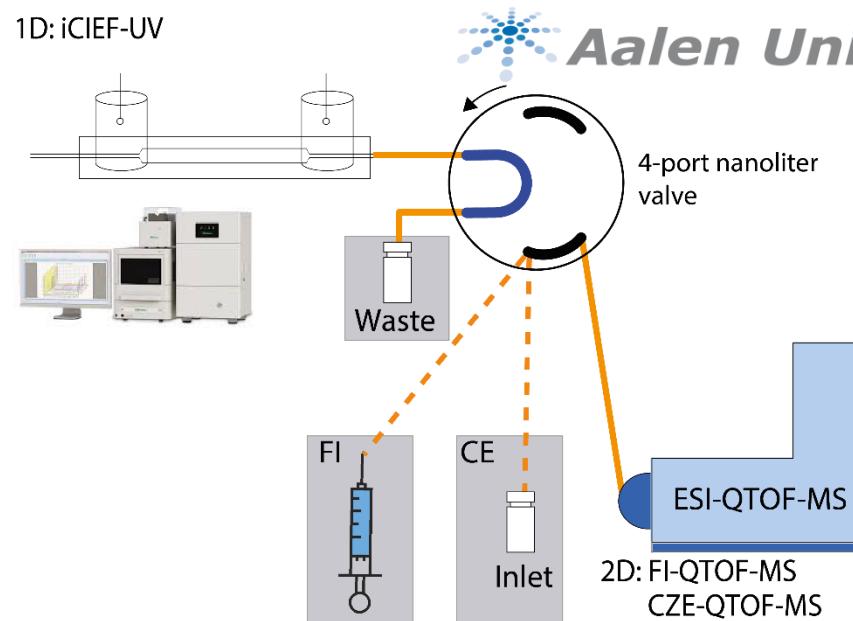

- Whole column imaging detection
 - No mobilization step required
 - High loadability of iCIEF cartridge (100 µm – 320 µm ID)
 - Preparative system, fraction collection or ESI-MS
 - Separation capillary: 50 mm
 - (sample) transfer capillary: 50 µm (ID)
 - Neutral (AD) or FC coated capillaries

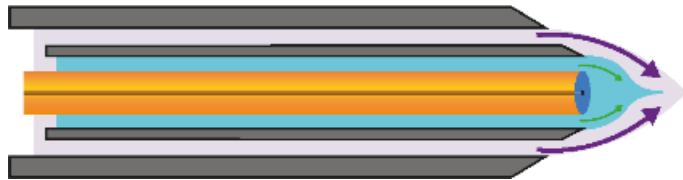

- Anolyte: 80 mM H₃PO₄
 - Catholyte: 100 mM NaOH
 - Focusing step: 1 kV (1 min), 2 kV (2 min), 3 kV (9 min)
 - Mobilization: 3 kV / 30 - 120 nL/min

2D-iCIEF-CZE/FI-MS

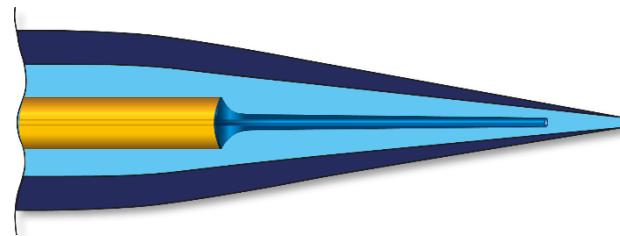

- Valve-based heart-cut 2D approach
 - Flow-injection (FI)-MS or CZE-MS
- Characterization of mAb charge variants

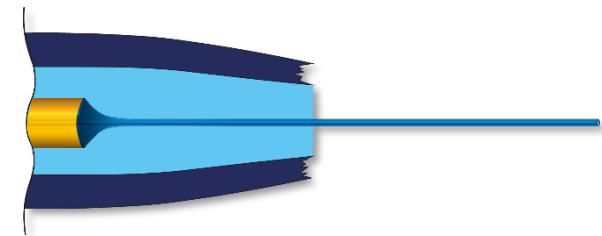

- Why online iCIEF-MS coupling?
 - Simplify instrumental setup and MS characterization of charge variant profile
- iCIEF sample composition: H₂O, ampholytes, mAb
 - Direct ESI approach of intact proteins is limited
 - Organic modifier required for efficient ionization
- How to add an organic modifier between iCIEF and MS?
- Maintenance of separation during mobilization?

Co-axial sheath liquid
interface (Agilent)

Nano flow sheath liquid interface
(nano SL) (comm. by CMP Scientific)
Hsieh_1999 RCM; Wojcik_2010 RCM

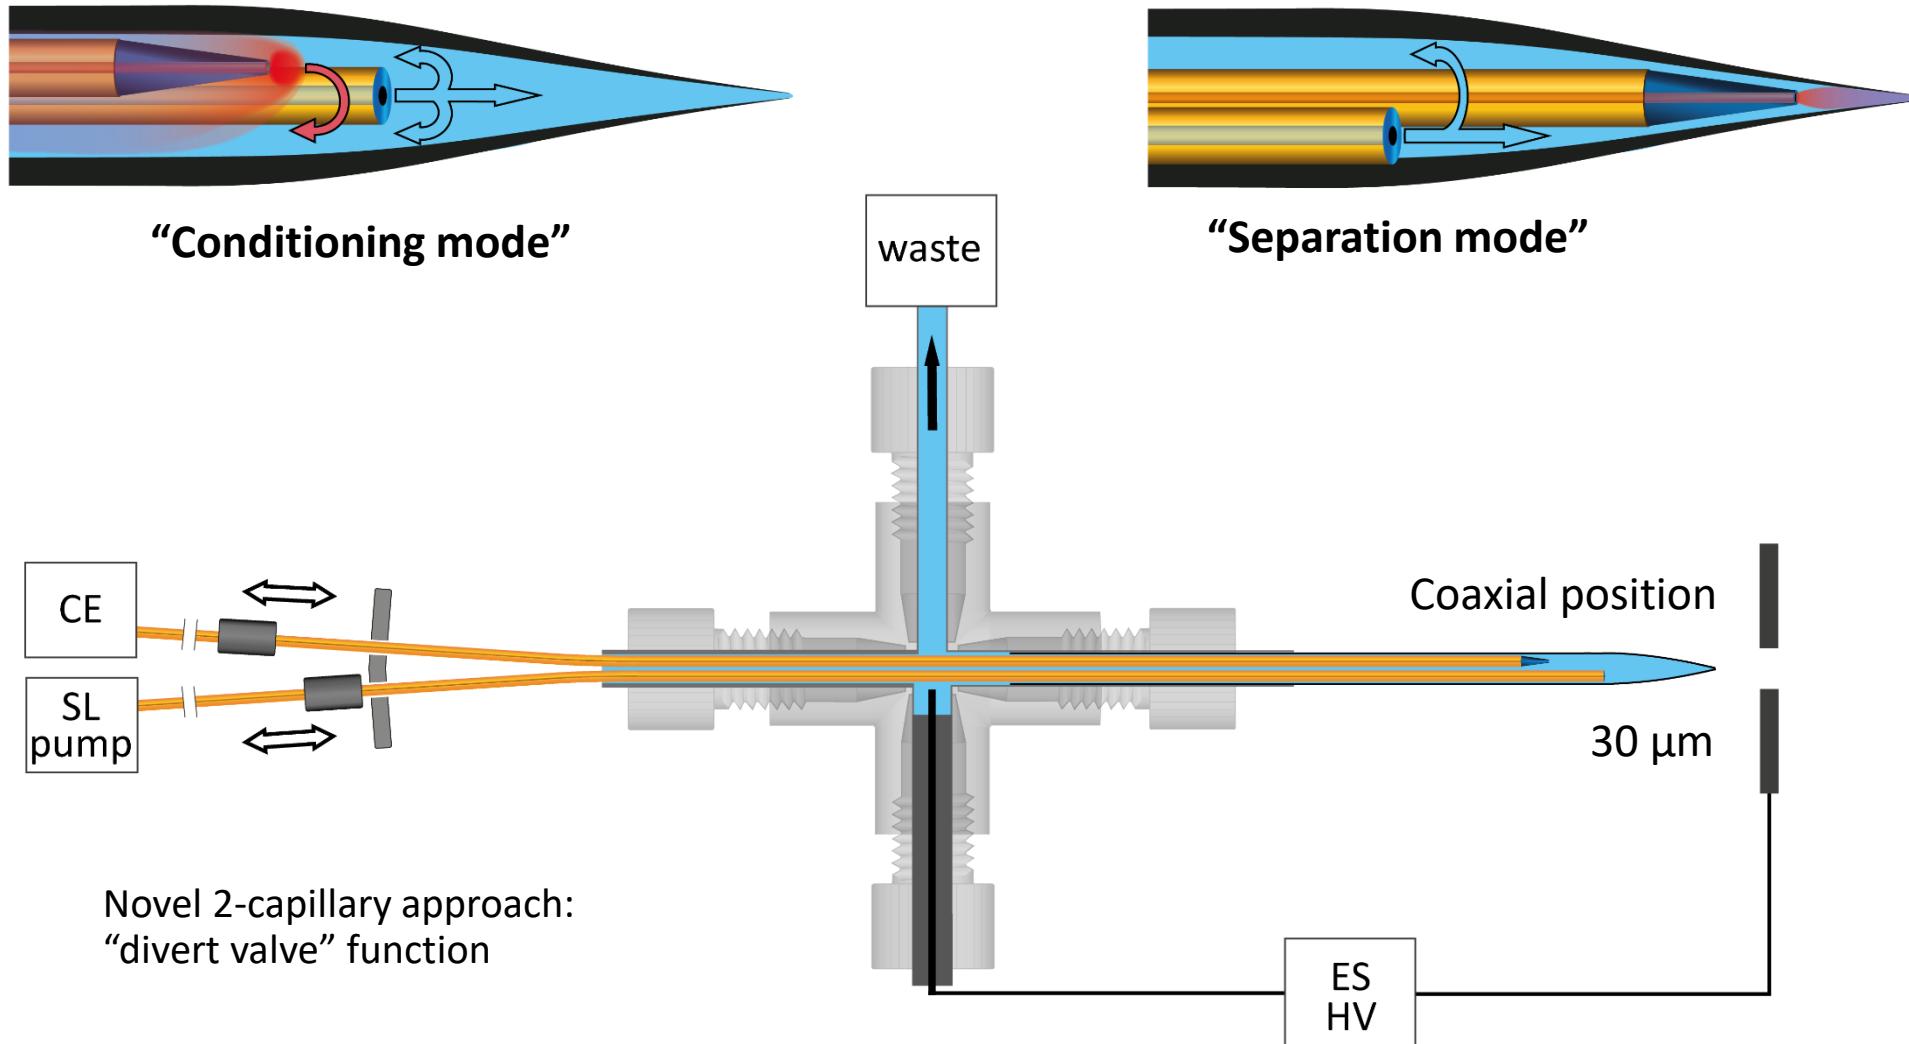

Sheathless porous tip interface
(comm. by Sciex)
Moini_2007 AC

Sensitivity improvement: 10x-40x

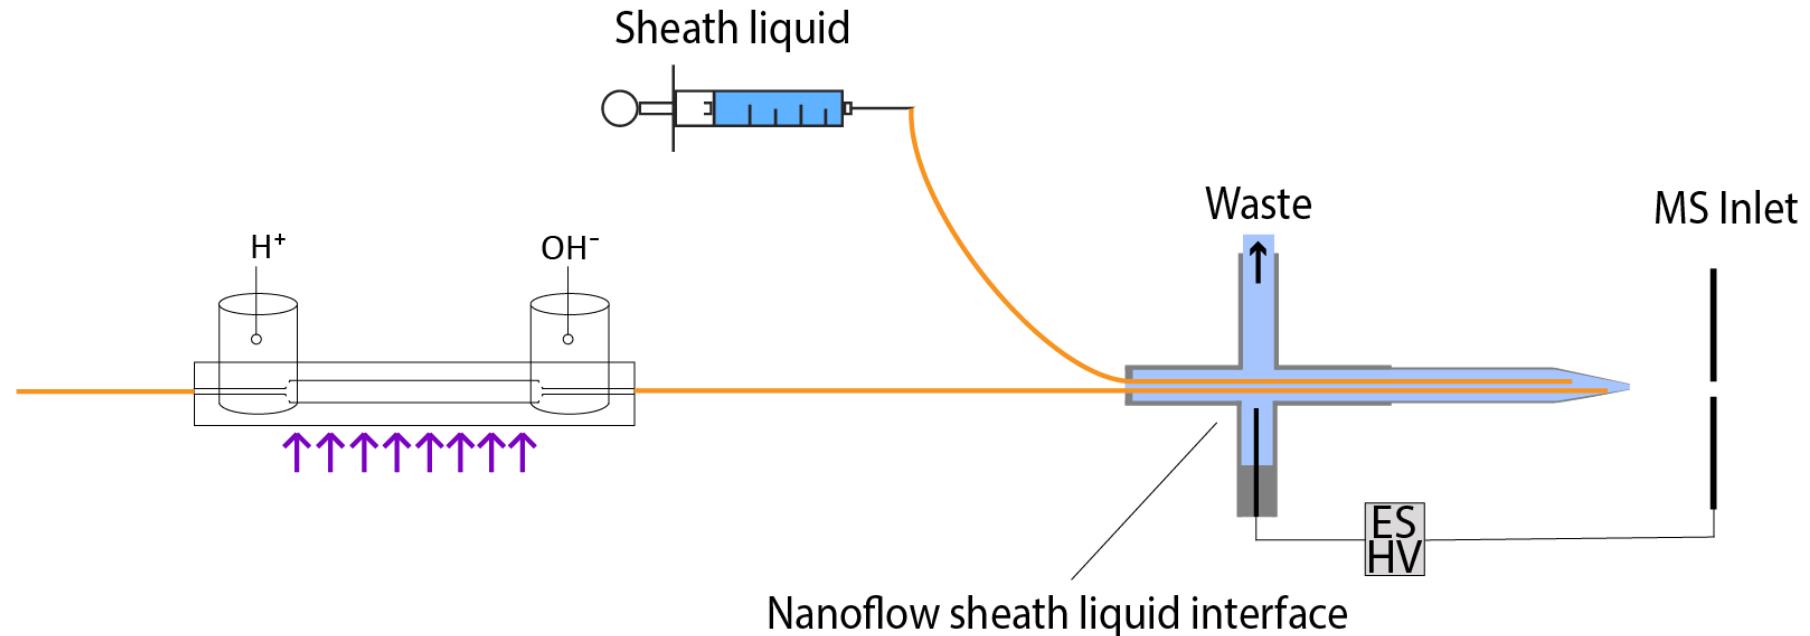

Sensitivity improvement: 10x-40x

iCIEF-MS coupling – nanoSL setup

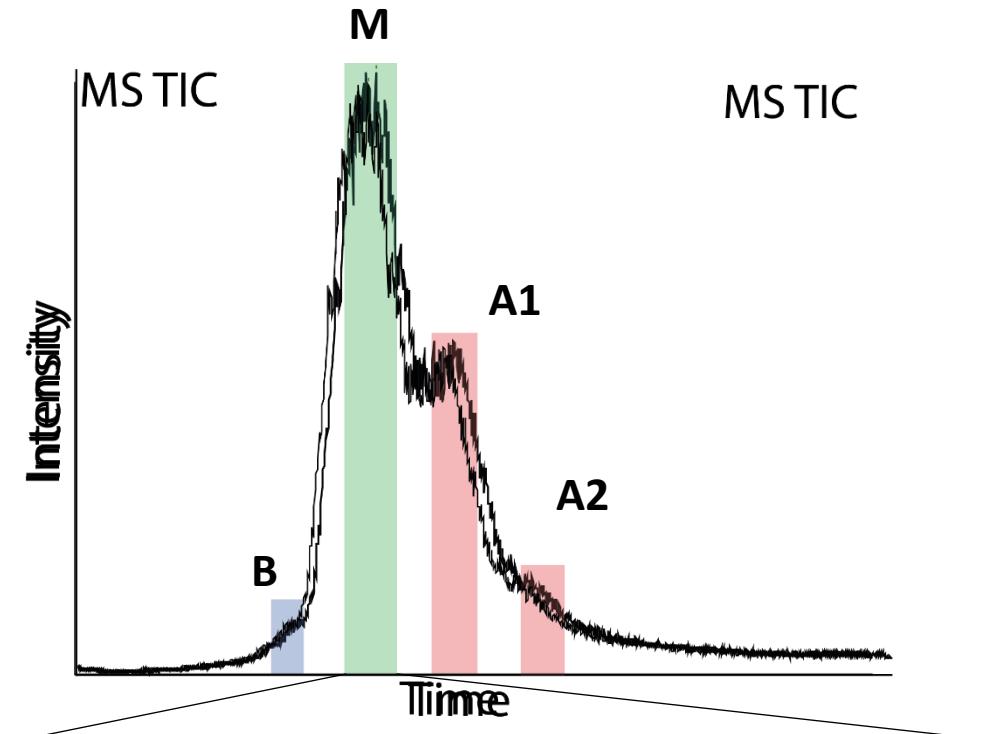

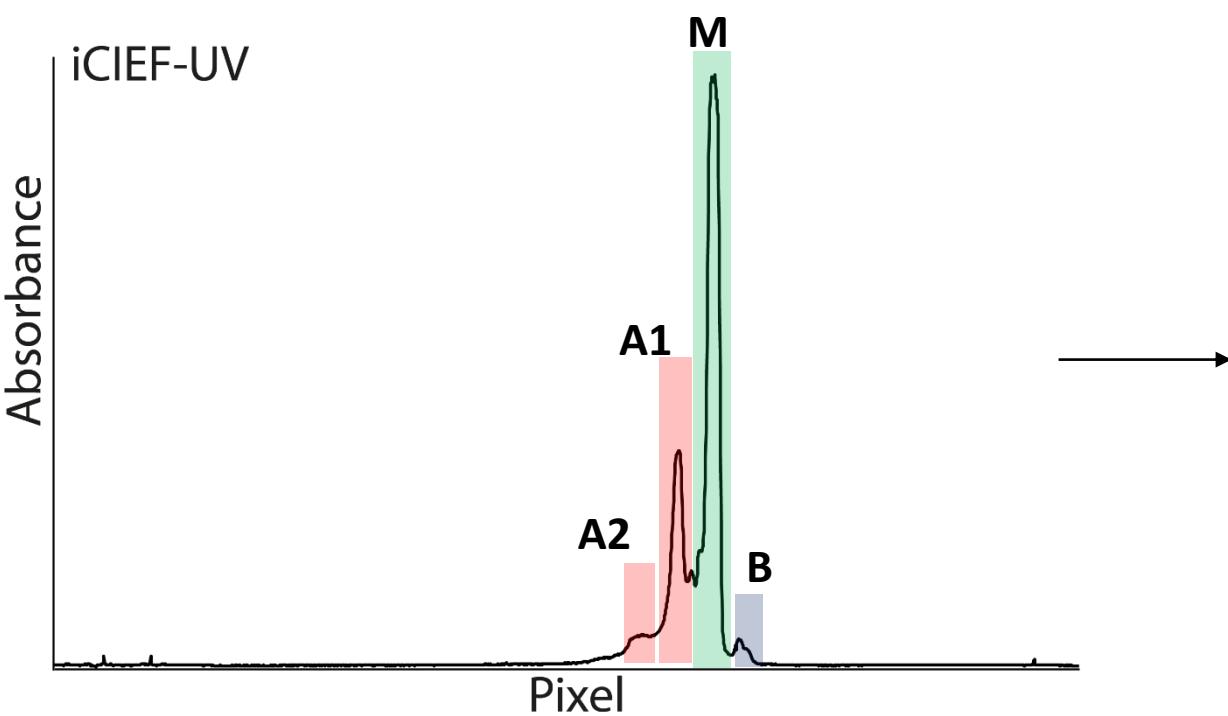

CEInfinite – Orbitrap Fusion Lumos

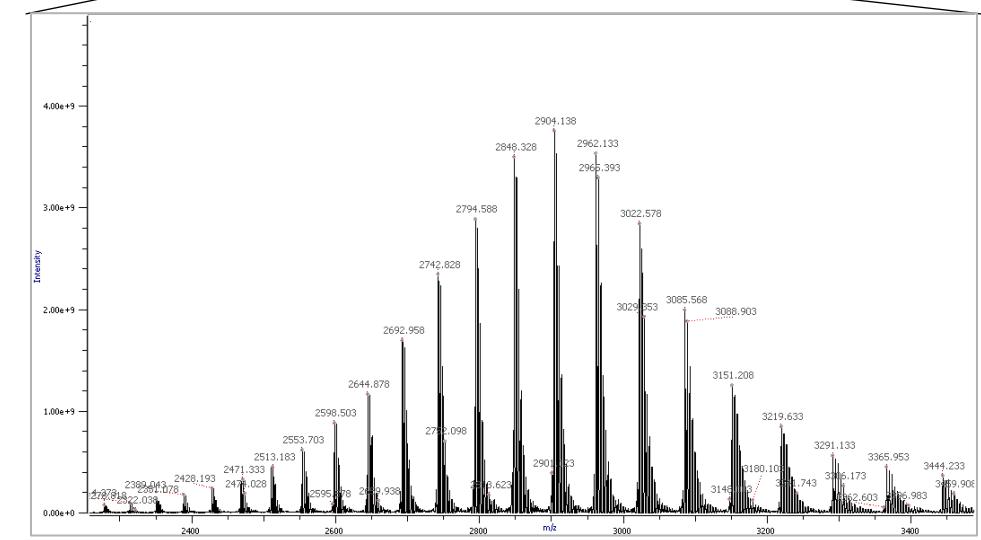

Electrospray emitter

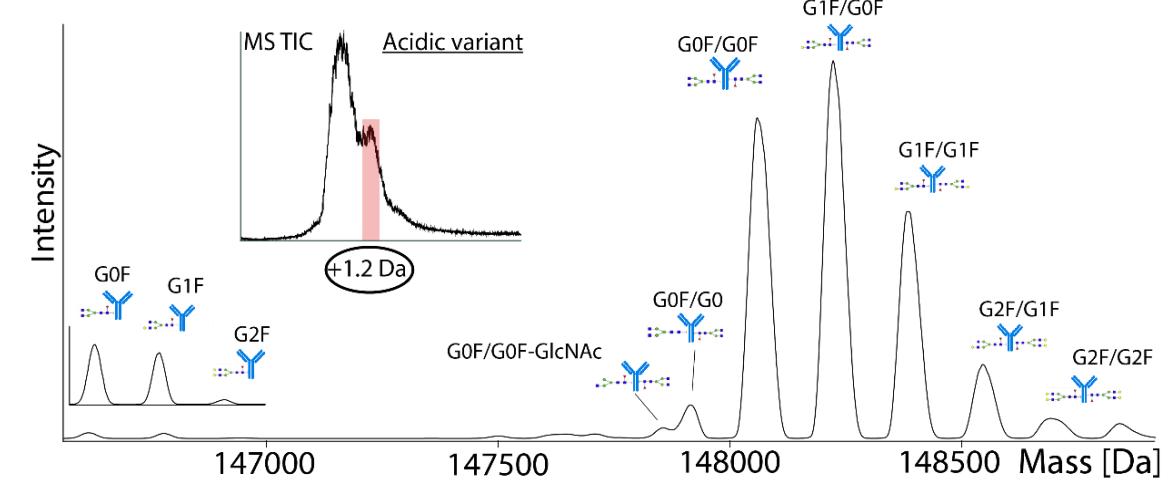

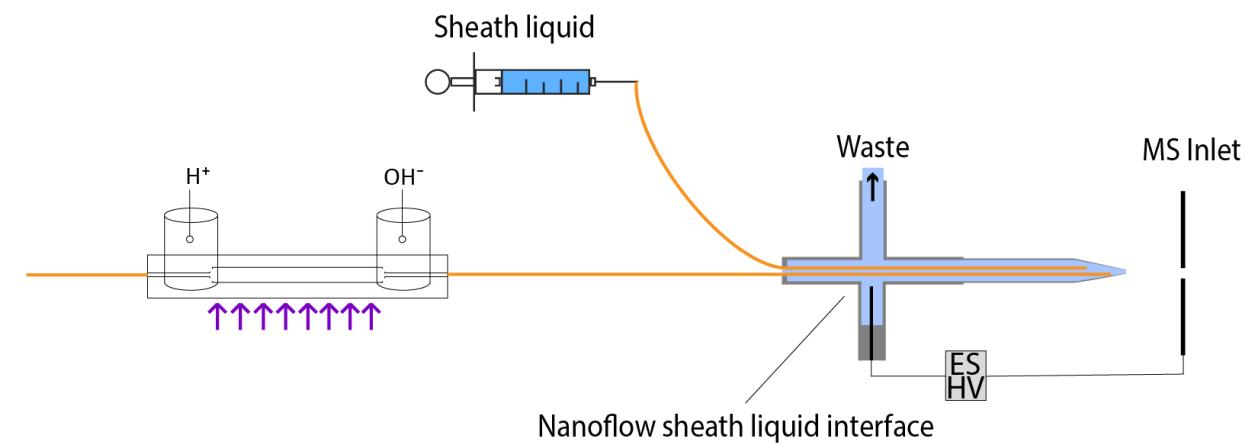

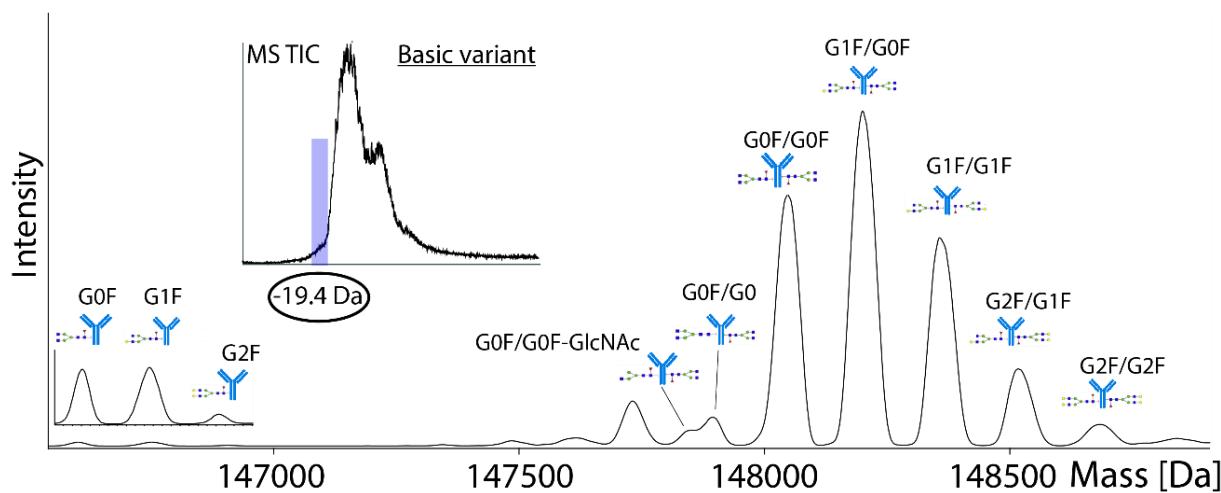

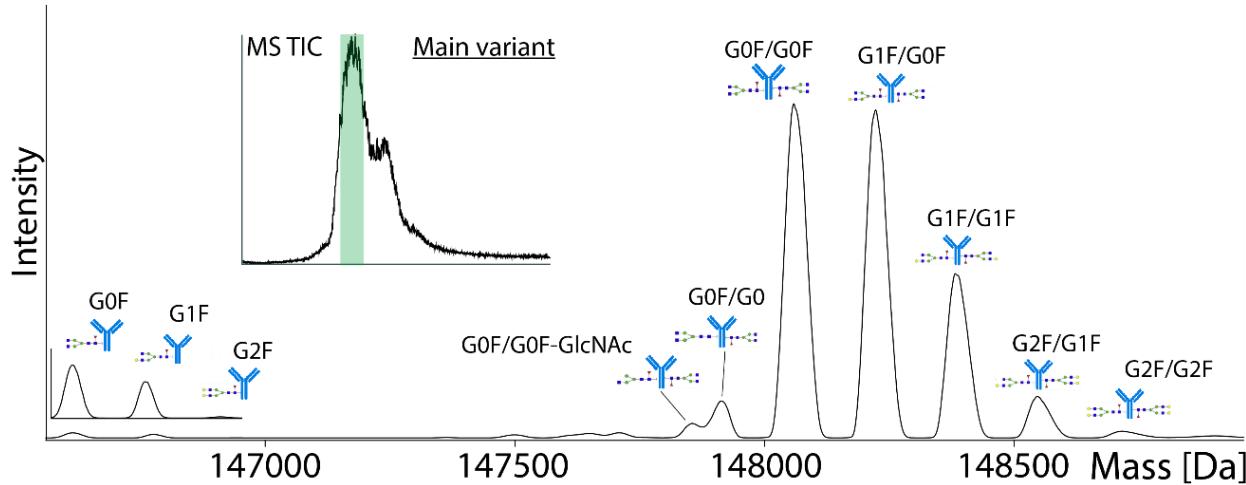

iCIEF-MS of Trastuzumab

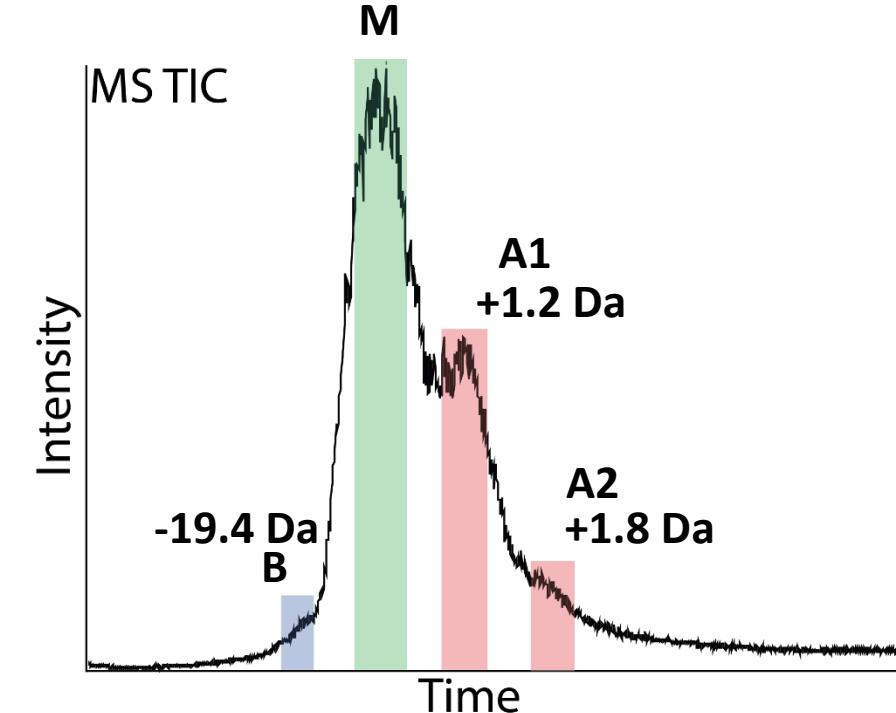

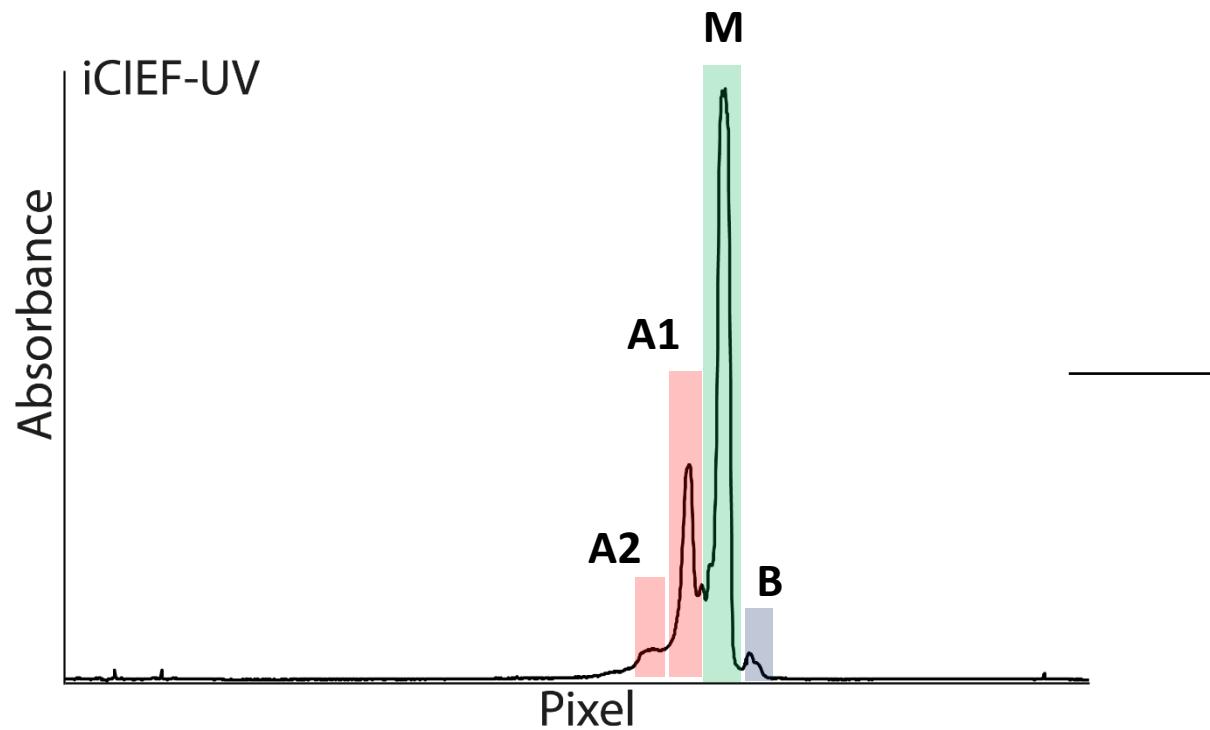

- Trastuzumab: 2 mg/mL (20 µL injected)
- Ampholytes: 0.5 % (v/v) Pharmalyte 3-10
- Sheath liquid: 1.5 % (v/v) Pharmalyte 8-10.5
- Sheath liquid: IPA:H₂O 1:1 + 1% (v/v) FA

iCIEF-MS of Trastuzumab

- Assignment of iCIEF-separated peaks to MS TIC profile possible
- Charge variants and minor glycoforms detectable
- Partial loss of separation during transfer

Modification	Δm [Da]
N → D/isoD	0.98
Succinimide	17
E → pE	18

- Successful online iCIEF-MS coupling with different MS instruments and ESI interfaces
- Nanoflow sheath liquid interface provides most promising approach for online iCIEF-MS mAb characterization
- Online iCIEF-MS enables charge variant profile characterization of mAbs
- Analysis of minor mAb charge variants and glycoforms feasible
- Maintenance of separation remains challenging
